The big five in paint preparation

# PLASTERSKIM

**Plasterskim** is more than just ready mixed crack filler; it is the ultimate and only product you would need to prepare your walls and other surfaces before you paint. Plasterskim is conveniently premixed and replaces the need for crack-fillers, gypsum plaster, plaster primers and undercoats. Plasterskim fills cracks, other imperfections and the texture of the surface, leaving behind a perfect finish to fully appreciate velvet or sheen paints.

Plasterskim has high levels of acrylic binder which makes it suitable for interior and exterior applications, providing a perfect bond with previous or subsequent acrylic paint and therefore does not need to be primed. Using Plasterskim will prevent the patchy appearances on walls as well as possible paint failures following the use of crack fillers. Plasterskim will also reduce the tendency for cracks to open up after repairs.

In most instances, the only preparation Plasterskim requires would be to scrape the surface removing cement spatter and high spots. Plasterskim can be applied directly onto newly plastered surfaces or on previously painted surfaces of sound condition. Plasterskim is applied with a steel trowel and the golden rule is to apply it as **thin** as possible, let the surface dictate but usually less than 0,5mm thick. Follow with a second coat and sand lightly if required.

**Contractors Skim** is designed as a replacement for the traditional first coater or filler coat that is usually preceded with a series of crack filling and spotting. Contractors Skim offers a combined solution that fills fine cracks and minor imperfections and prepares the entire surface for its final coat. Contractors Skim will give a continuous good finish if applied on wood or steel floated plaster. Contractors Skim can also be used in conjunction with Plasterskim in a two-coat system.

**Full Skim** is used to pre-fill deeper imperfections, as a first coat to remove textured surfaces and as the jointing compound on plasterboards and drywall systems. Full Skim can be applied directly on painted and unpainted plaster and does not require being primed before you paint. When applied as a jointing compound on plasterboard it should be used in conjunction with the self-adhesive re-enforcing tape. Use Plasterskim for the second coat to achieve that perfect smooth finish.

**Plasterfix** is a new generation fiber re-enforced ready-mixed crack solution. Unlike conventional crack fillers, Plasterfix offers increased adhesion with the sides of the crack and will prevent the crack from re-appearing. It is supplied in a similar, soft and workable paste and is also available in a handy 310 ml tube for getting to the bottom of deep cracks. Using Plaster Fix in a tube will prevent the repaired cracks in textured walls from showing smooth patches. Plaster Fix can be used interior as well as exterior and does not need to be primed before it can be painted.

**Poly Stick** is an acrylic adhesive and is used for the installation of lightweight wall and ceiling decorations. Poly Stick can be applied directly on most building substrates, i.e. polystyrene, wood, raw or previously painted plastered walls, ceiling boards, plasterboard and concrete. Poly Stick is also available in a handy 310 ml tube for easy application.
